-!- Copraction 3.

-!- Copraction 3.

-!- SUBUNIT: THE PRECURSOR POLYPEPTIDE IS SUBSEQUENTLY CLEAVED TO YIELD SUBGRAINS L AND H. THESE REMAIN LINKED BY A DISULFIDE BRIDGE AND ARE NON-TOXIC AFTER SEPARATION.

-!- MISCELLANEOUS: THE C-TERMINAL OF THE HEAVY CHAIN BINDS TO GANGLIOSIDE RECEPTORS.

-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY M27.
                                                                                                                                                                                                                                                                                                                                                     NAT. STRUCT. BIO1. 4:788-792(1997).

-1- FUNCTION: TETANUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
WHENE IT CAN WOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
WHERE IT CAN WOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
ENDOPERILDASE THAT CAPALYZES THE HYDROLYSIS OF THE 76-GLN-|-PHE-77
                                                                                                                                                                                           identification of SUBSTRATE.

C; Comment: The source of this protein was an extrachromosomal plasmid.
C; Comment: The precursor is cleaved by endogenous proteinase activity to form light (fra dual chains are not toxic when separated). The amino end of the heavy chain (fragment B) C; Comment: Fragment E forms ion channels in a light bilayer. Fragment C binds to ganglid C; Comment: This potent neurotoxin binds to peripheral neuronal synapses, is internalized presynaptic neurons. It inhibits neurotransmitter release by proteolytic cleavage of sy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                C.Function:
A:Description: blocks neuroexocytosis via hydrolysis of a Gln-Phe peptide bond in synapt

Sequence 2, Application US/09862849
Patent No. US20020013274A1
GENERAL INFORMATION
APPLICANT: Sudhir Paul
APPLICANT: Gennady Gololobov
TITLE OF INVENTION: Methods for Identifying Inducers and Inhibitors of Proteolyti:
FILE REFERENCE: UNMC 63123 DIV
CURRENT APPLICATION NUMBER: US/09/862,849
CURRENT FILING DATE: 2001-08-29
PRIOR APPLICATION NUMBER: US 09/046,373
PRIOR APPLICATION NUMBER: US 09/046,373
NUMBER OF SEQ ID NOS: 10
                                                                                                                                                         Gaps

US.10-241-596-145

Sequence 145, Application US/10241596

Publication No. US20030166238A1

GENERAL INFORMATION:
APPLICANT: Microbiological Research Authority
APPLICANT: The Speywood Laboratory Limited
TITLE OF INVENTION: Recombinant Toxin Fragments
FILE REFERENCE: 1581.013003

CURRENT APPLICATION NUMBER: US/02/21,596

CURRENT FILING DATE: 1999-02-03

PRIOR FILING DATE: 1999-02-23

PRIOR FILING DATE: 1999-02-23

OTHER INFORMATION: Amidated glycine or glycinamide
NAME/KEY: PEPTIDE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           US-01-09 -848-834A-18
Sequence 18, Application US/09848834A
Sequence 18, Application US/09848834A
Patent No. US20020006416A1
GENERAL INFORMATION:
APPLICANT: Aphton Corporation
TITLE OF INVENTION: Chimeric Peptide Immunogens
FILE REFERENCE: 1102865-0047
CURRENT APPLICATION NUMBER: US/09/848,834A
CURRENT FILING DATE: 2001-05-04
PRIOR PAPLICATION NUMBER: 60/202,328
PRIOR PILING DATE: 2000-05-05
NUMBER OF SEQ ID NOS: 20
SEQ ID NOS: 20
SEQ ID NO 18
LENGTH: 50
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         LOCATION: (11)...(16)

ALIGNMENTS

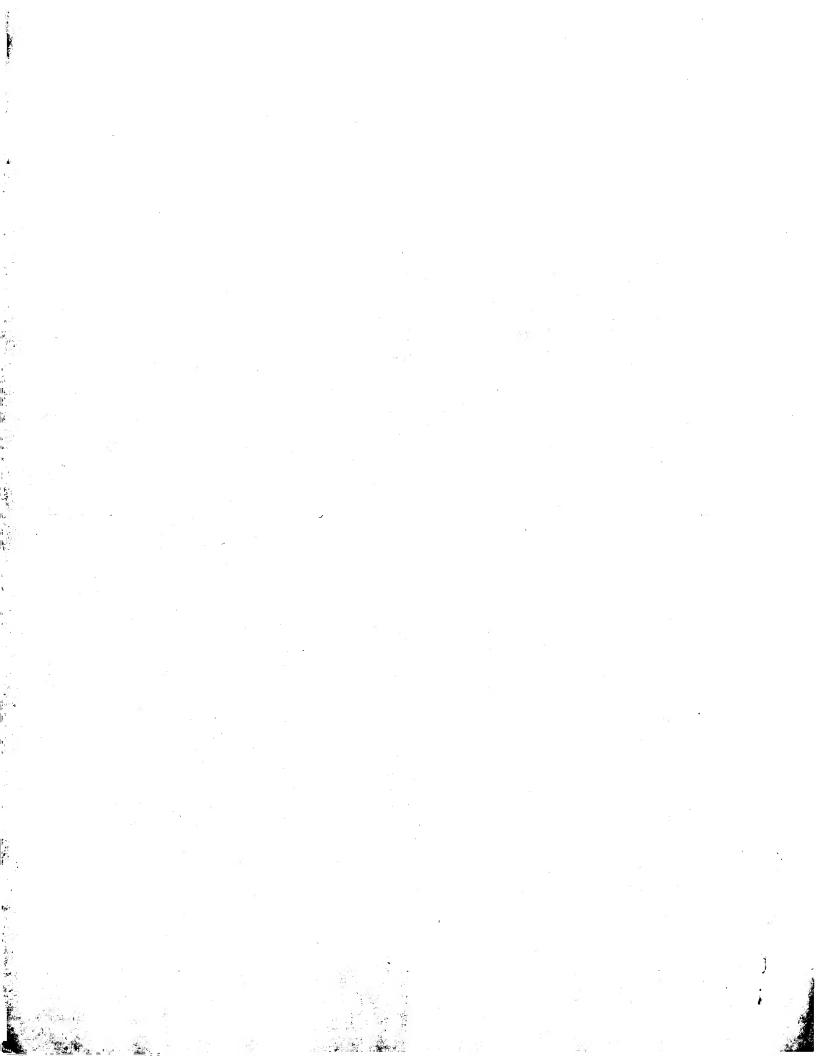

```
OTHER INFORMATION: Chimeric peptide consisting of amino acid sequence 1-10 of the OTHER INFORMATION: RH hormone linked by a spacer to amino sequence 830-844 of the OTHER INFORMATION: tanus toxoid precursor (Tentoxylysin)

NAME,KEY: MOD_RES
LOCATION: (1)...(1)

OTHER INFORMATION: Pyroglutamic acid or 5-oxoproline
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CCATION: (17)...(31)

                                                                                                                                                                                                                                                             This sequence represents the RTS* hybrid protein which is encoded by the RTS* expression cassette. This hybrid consists of a methionine residue derived from S. cerevisiae TDH3 gene sequence, three amino acids, Met-Ala-Pro, derived from a nucleotide sequence created by the cloning procedure used to construct the hybrid gene, a stretch of 189 amino acids representing amino acids 10 to 398 of the circumsporozoite protien (CSP) of plasmodium falciparum strain NF54, an amino acid Arg created by the cloning procedure, four amino acids, Pro-Val-Thr-Asn, representing the four achoxy terminal residues of hepatitis B virus (HBV), adw serotype, preS2 protein, and a stretch of 226 amino acids specifying the S protein of HBV, adw serotype. This protein, and RTS (see also ARM37796), may be combined with an adjuvant and used in a vaccine for preventing plasmodium infections.

The specification describes N-Acylated pseudopeptides, which have a neutral or charged acidic group at one terminal and a functionalized auxiliary spacer at the other. The pseudopeptides show immunomodulatory and adjuvant action, based on activation of antigen presenting cells dendritic cells, induction of differentiation of dendritic cells, induction and induction of maturation of immunocompetent cells trains originating from hematopoeitic and lymphoid organs. They reinforce humoral and cellular immunity. They can be grafted onto antigens (to modulate immune response) or onto drugs (to improve the therapeutic activity or targeting). The pseudopeptides are thus useful in human or veterinary medicine as immunizing or diagnostic agents. Typically, they are used as adjuvants together with (or covalently bonded to) antigens for vaccination against viral, parasitic/protozoal, microbial or fungal infections; incubated with blood
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     realise x vivo, to render the cells immunocompetent before reintroduction in vivo; or used in therapy of certain autoimmune diseases. The pseudopeptides are useful as carriers for antigens or other therapeutic agents due to their ability to form non-covalent bonds via the hydrophobic or hydrophilic auxiliary spacer. The present sequence represents a peptide, which has conjugation sites for the pseudopeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps

note= "Derived from S. cerevisiae TDH3 gene sequence"
                                                                                                                                                                                                                                                                                                                                                                                                                 the RTS expression cassette. This hybrid consists of a methionine residue derived from S. cerevislae TDH3 gene sequence, three amino acids, Met Ala-Pro, derived from a nucleotide sequence, three amino acids method from a nucleotide sequence created by the cloning procedure used to construct the hybrid gene, a stretch of 189 amino acids representing amino acids 210 to 398 of the circumsporozotic protien (CSP) of plasmodium falciparum strain 768, an amino acid Arg created by the cloning procedure, four amino acids pro-Val-Thr-Asn, representing the four carboxy terminal residues of hepatitis B virus (HBV), adw serotype, preS2 protein, and a stretch of 256 amino acids specifying the S protein of HBV, adw serotype. This protein, and RTS* (see also AAR37797), may be combined with adjuvant and used in a vaccine for preventing plasmodium infections. The vaccines produce a humoral response and also a cellular immune
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

```
Sequence of the CS gene (AAN81108) is from lambda-mpfl. A recombinant DNA molecule is claimed, comprising functional DNA coding sequence fused, in phase, to a portion of the Pre-S2 region of a hepatitis B virus (HBV) Pre-S2-S protein coding sequence. The functional DNA coding sequence comprises the Pre-S2 coding sequence, Pre-S1 coding sequence or entire Plasmodium, or a HIV coding sequence such as an HIV envelope gene sequence, e.g. HIV C7 protein coding region, HIV Peptide 121 coding region, or HIV Dreesman peptide coding region, HIV (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                        DNA encoding hepatitis B virus antigens and hybrids contg. them used for expression in yeast to obtain vaccines and bivalent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       æ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length 411;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1;
                                                                                                                                                                                                                                                                                                                                     the P. falciparum circumporozoite (CS) protein [Dame et al., Science 225: 593 (1984)], and the influenza virus non-structural protein 1 (NSI), [Baez et al., Nucleic Acids Research, 8: 5945 (1980)]. The DNA encoding the 1st 81 AAs of the N-terminal of NSI (1980)]. The DNA encoding the 1st 81 AAs of the N-terminal of NSI (NSI 81) is linked to a synthetic sequence encoding four repeat units (the variant form) from the immunodominant region, which in turn is linked via a synthetic sequence to DNA encoding Region II-contg. Contg. flanking region II-contg. flanking the Asp (at the C-terminal of the linker) from the Region I-contg. CS flanking region is an artifact of a filledin BamHI site, the Gly separating the Region II-contg. CS flanking region I and II-contg. CS flanking region I and III-contg. CS flanking region is an artifact of a filledin regions. The peptide can be used in a vaccine for protection

the polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., Science 225: 593 (1984)], and the influenza virus non-structural protein 1 (NSI), [Baez et al., Nucleic Acids Research, 8: 5845 (1980)]. The DNA encoding the 1st 81 AAs of the N-terminal of NSI (NSI_81) is linked to a synthetic sequence encoding four repeat units from the immunodominant region, which in turn is linked via a synthetic sequence to DNA encoding Region I conty, flanking region less the 18 AA signal region. This is linked to DNA encoding Region II-conty flanking region. The Pro residue separating the Asp (at the C-terminal of the linker) from the Region I conty. CS flanking region is an artifact of a synthetic Foki/TthIII I linker. The regions is an artifact of a synthetic Foki/TthIII I linker. The ceptons is an artifact of a synthetic Foki/TthIII I linker. The See also AAR12306-R1231 and AAR13175-R13179.

                                                                                                                                                                                                                                                                  Region
                                                                                                                                                                                                                                                                                                Region
 Ξ,
                                                                                                                                                                                                                                                                                                                                                               The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., collence 225: 593 (1984)], and the influenza virus non-structural protein 1 (NSI), [Baez et al., Nucleic Acids Research, 8: 5445 (1980)]. The DNA encoding the 1st 81 AAs of the N-terminal of NSI (NSI, 91) is linked via a synthetic sequence to DNA encoding Region I conty. Flanking regionless the 18 AA signal region, which in turn is fused to DNA encoding Region II-conty. flanking regionless the 18 AA signal region, which in turn is fused to DNA encoding Region II-conty. Flanking region is designated RLAduth. The pro residue separating the ASP (at the C-terminal of the linker) from RLAduth is an artifact of a filled in BamHI site; the Gly separating Region I and FOAL/TthIII I linker. The peptide can be used in a vaccine for protection against malaria
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                  Polypeptide comprising immunogenic determinants from P falciparum

The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., protein = 255 : 593 (1984)], and the influenza wirus non-structural protein I (NSI), [Baez et al., Nucleic Adids Research, 8 : 5845 (1980)]. The DNA encoding the 1st 81 AAS of the N-terminal of NSI (NSI_81) is linked via a synthetic sequence to DNA encoding Region I conty. flanking region less the 18 AA signal region. This is linked to a synthetic sequence encoding two repeat units from the immunodominant region, which in turn is fused to DNA encoding Region Ir-conty. flanking region. The Pro residue Separating the C flanking region is an artifact of a filled-in BamHi site; the Gly separating the repeat units and the Region Ir-conty. C flanking region is an artifact of a synthetic FokI/TthIII I linker. The region is an artifact of a synthetic FokI/TthIII I linker. The See also AAR12306-RL231 and ARR13175-RL31179.

                                                                                                                                                                                                                                                                                                                         The polypeptide is prepd. by genetic engineering of genes encoding the P. falciparum circumsporozoite (CS) protein [Dame et al., science 225 : 593 (1984)], and the influenza virus non-structural protein I (NSI). [Baez et al., Nucleic Acids Research, 8 : 5845 (1980)]. The DNA encoding the 1st 81 AAs of the N-terminal of NSI (NSI_81) in linked via a synthetic sequence to DNA encoding Region I contg. flanking regionless the 18 AAs ignal region, which in turn is fused to DNA encoding Region II-contg. flanking regionless the first nine N-terminal AAs. This CS fusion is designated RLideltag. The Pro residue separating the Asp (at the C-terminal fithellinker) from Richeltag is an artifact of a filled in BamHI site. The peptide can be used in a vaccine for protection against

antibodies against gonadotropin releasing hormone (GRBH also known as luteinising mormone releasing hormone (GRBH also known saluteinising hormone releasing hormone, LHRH) comprising a fusion peptide which comprises a promiscuous helper T-cell peptide epitope and immunomimic peptide epitope or its analogue. The synthetic immunogen is useful inducing an immune response against GnRH in an animal subject, and as such is useful as a contraceptive and in the treatment of diseases such as cancer (of the breast, uterus and other gynaecological cancer), endometriosis, uterine fibroids, benign prostatic hypertrophy and prostate cancer. The immunogen is effective in eliciting high and specific anti-GRRH antibody titres. The present sequence is a synthetic immunogen of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a synthetic immunogen for inducing specific

                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antibodies against gonadotropin releasing hormone (GRRH also known as luteinising hormone releasing hormone. LHRH) comprising a fusion peptide which comprises a promiscuous helper T-cell peptide epitope and immunomimic peptide epitope or its analogue. The synthetic immunogen is useful inducing an immune response against GRRH in an animal subject, and as such is useful as a contraceptive and in the treatment of diseases such as cancer (of the breast, uterus and other gynaecological cancer), endometriosis, uterine fibroids, benign prostatic hypertrophy and prostate cancer. The immunogen is effective in eliciting high and specific anti-GRRH antibody titres. The present sequence is a peptide from circumsponsocite protein, CSP, a promiscuous helper T-cell peptide epitope used in the immunogen of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 luteinising hormone releasing hormone; LäRH; contraceptive; promiscuous helper T-cell peptide epitope; immunomimic peptide epitope; breast cancer; uterine cancer; gynaecological cancer; endometriosis; uterine fibroid; benign prostatic hypertrophy; prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a synthetic immunogen for inducing specific

                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                            peptide which comprises a promise could be per reel peptide epitope and immunominic peptide epitope or its analogue. The synthetic immunominic peptide epitope or its analogue. The synthetic immunomen is useful inducting an immune response against GnRH in an animal subject, and as such is useful as a contraceptive and in the treatment of diseases such as cancer (of the breast, uterus and other hyparecological cancer), endometriosis, uterine fibroids, benign prostatic hypertrophy and prostate cancer. The immunogen is effective in eliciting high and specific anti-GnRH antibody fittres. The present sequence is a synthetic immunogen of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           luteinising hormone releasing hormone; LHRH; contraceptive; promiscuous helper T-cell peptide epitope; immunomimic peptide epitope; breast cancer; uterine cancer; gynaecological cancer; endometriosis; uterine fibroid; benign prostatic hypertrophy; prostate cancer.

GENERAL INFORMATION:

APPLICANT: Ladd, Anna
APPLICANT: Ladd, Anna
APPLICANT: Ladd, Anna
APPLICANT: Lamb, Timochy
TITLE OF INVENTION: Immunogenic LHRH peptide constructs
TITLE OF INVENTION: and synthetic universal immune stimulators for vaccines
NUMBER OF SEQUENCES: 114
CORRESPEDUBENCE ADDRESS:
ADDRESSEE: Maria C.H. Lin
STREET: New York

CITY: New York
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

Patent No. 6090388

GENERAL INFORMATION:
APPLICANT: Wang, Chang Yi

TITLE OF INVENTION: PEPTIDE COMPOSITION FOR
TITLE OF INVENTION: IMMUNE DISORDERS
INTERPROBLES: ADDRESS:
ADDRESSEE: WORGAN & FINNEGAN
STREET: 345 PARK AVENUE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Length 21;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 48.6%; Score 89; DB 2; L 100.0%; Pred. Patent No. 584346
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Ladd, Anna
APPLICANT: Wang, Chang Yi
APPLICANT: Zamb, Timothy
TITLE OF INVENTION: Immunogenic LHRH peptide constructs
TITLE OF INVENTION: and synthetic universal immune stimulators for vaccines NUMBER OF SEQUENCES: 114
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           48.6%; Score 89; DB 1; Length 21; 100.0%; Pred. ```
OTHER INFORMATION: Chimeric peptide consisting of amino acid sequence 1-10 of the INFORMATION: RH hormone linked by a spacer to amino sequence 830-844 of the UTHER INFORMATION: tanus toxoid precursor (Tentoxylysin)
NAME, KEY: MOD_RES
LOCATION: (1)..(1)
OTHER INFORMATION: Pyroglutamic acid or 5-oxoproline
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             OTHER INFORMATION: Chimeric peptide consisting of amino acid sequence 1-10 of hum oTHER INFORMATION: GRHH linked by a spacer to amino acid sequence 830-844 of Tema OTHER INFORMATION: toxoid precursor (Tentoxylysin) linked by a spacer to amino content information: sequence 1-10 of GRRH
